

Who's eavesdropping on your communications?

Is privacy important to you? With the advancement of Internet communications we have lost control of our privacy.

Everything we do on the Internet passes through a server, is cached (copied and stored) or easily grabbed by anyone with the desire to find it. Voice over IP (VoIP), file transfer, cellular calls, 3G, 4G...all this information floats out there. Did you know that Google Voice activity is actively stored on Google servers? Or that a Skype call can be easily eavesdropped on?

F4W directly addresses your security with **Core DaVE** (Data and Voice Encryptor), a secure communications tool that assures your privacy. It delivers a level of security to an organization not found in a simple communications application. We offer a better, secure way to chat online, exchange data files, and make a phone call or alert someone to a problem.

Get control of your communications today!

Core DaVE™

What is Core DaVE?

Core DaVE (Data and Voice Encryptor) is a revolutionary, easy to use communications tool that changes the way you do business. It provides its users a secure way to share information via voice, chat or file transfer. All information is encrypted and secured via Virtual Private Network technology, there is no complicated or expensive hardware to purchase and maintain.

How does it work?

Core DaVE utilizes the power and flexibility of Voice over IP (VoIP) and the Internet. It is installed on your device and automatically connects with everyone within your secure group. The information exchange with Core DaVE is between users, there are no servers or devices handling the information.

Why is it different from other tools?

Core DaVE securely connects people via a virtual, cloud-based service, first eliminating the single point of failure for traditional web- or network-based solutions and secondly removing the security flaws that haunt these types of solutions.

Why do you need Core DaVE?

Privacy - Is privacy important to you? If so, you must have Core DaVE for your business. Cellular and VoIP are inherently unsecure and to secure them, you need to purchase, implement and maintain expensive and complicated hardware. For data, the files you send pass through email servers which hold copies of your data and are easily accessible.

Resiliency - What would you do if your telephone, email or cellular phone stopped working? Core DaVE provides an "always on" 1-800 telephone number. Regardless of the circumstance, you will always be able to make or receive a call.

File Sharing - No matter how large of a file that you need to share with someone, Core DaVE allows for unlimited transfer of files from one user to another without bandwidth constraints. More importantly, the transfer of information is secure and HIPAA compliant.

Alerting - An emergency can be defined in many ways, whether it is truly a life threatening emergency or a case in which you need to speak to someone immediately, sending an alert to a single user, group of users or everyone on your list is easy. Through a simple point and click process, alerts can be easily sent to all devices, in a matter of seconds, which is especially important when SECONDS COUNT!

Get started today! Contact F4W at 866.823.5252.

Core DaVE:

- ~ low cost, secure, end-to-end communications tool
- ~ private, virtual, cloud-based for easy access from anywhere
- ~ encrypted voice, chat and data
- ~ helps you meet HIPAA compliance standards
- ~ resilient, always available 1-800 telephone number
- ~ built in mass notification abilities

Simple. Flexible. Affordable. Interoperable.
